The Emergent View of IT and Organizational Change

Pontus Fryk, Einar Iveroth
Department of Business Studies, Department of Business Studies, Uppsala, Sweden.

Abstract:
In the modern business world it is impossible to distinguish between technology and organization. All activities are somehow supported by technology and the nature and structure of organizations influence the technological development. For that reason it is crucial to recognize the reciprocal relationship between technology and organization, and acknowledge the phenomena as highly intertwined. This is the case in practice but it should also be reflected in associated research. In this paper, a bibliometric approach serves as the foundation for a study of whether a dynamic view of technology and organization is represented in affiliated scientific writings the last decade. More specifically, research in connection to information technology and organizational change is considered. The results from the investigation paint a scattered picture lacking clear indications of a tendency suggesting a move from a deterministic towards an emergent scientific view of these concepts.
