Extending an E-Learning Model into Enterprise Resource Planning (ERP) Curriculum

Brendan McCarthy
School of Information Systems
Victoria University
Melbourne, Australia
Brendan.McCarthy@vu.edu.au

Abstract

The expansion of global education has created a new market for the e-education industry. Many universities have introduced distance learning programs and are trialling e-learning tools to support this expansion. Certain curriculum is more suited to the application of e-learning. The curriculum associated with the teaching of Enterprise Resource Planning (ERP) systems is one such area.

ERP systems offer a software-based system that handles an enterprise's total information system needs in an integrated fashion. Many universities have joined alliances with ERP vendors to allow the integration of ERP systems into their programs. This paper outlines the experiences of Victoria University in offering ERP education through a strategic alliance with the ERP vendor, SAP. The University is extending its offshore programs by offering ERP education in the Asian region and has developed an E-learning model to assist this expansion. The ERP e-learning model blends synchronous and asynchronous content. Asynchronous e-learning does not involve the presence of a teacher. Typically the learning content is located on a web server that students can access using the Internet. Synchronous e-learning requires the learner and teacher to be present in the event at the same time. It is a real-time, instructor-led online learning event in which all participants are available at the same time and can communicate directly with each other. The model uses four technologies to facilitate teaching: application service provision (ASP), web-CT, computer-based training and virtual classroom technology. The ERP e-learning model provides an innovative and efficient means to deliver ERP curriculum. It is able to provide greater flexibility in offshore subject delivery and to maximise student learning outcomes. This is particularly relevant in light of recent international medical (SARS) and terrorists incidents.

1. Introduction

The expansion of global education has created a new market for the e-education industry. Many universities have introduced distance learning programs and are trialling e-learning tools to support this expansion. Many studies have

been carried out on the effects of e-learning on a university's education strategy. Chan and Welebir [4] describe the effects of the Internet and online distance education on a university's overall strategy. They present a strategic agenda that traditional universities can follow to develop e-learning programs including the suggestion of forming a strategic alliance to enter the e-education market and expand globally. Gibson [6] suggests that the virtual classroom will eventually replace the traditional classroom. His study explores methods to enhance the distance learning experience and create a competitive advantage.

Curriculum associated with the teaching of Enterprise Resource Planning (ERP) systems is more suited to the use of e-learning tools than many other areas especially where the curriculum is expanded beyond the traditional boundaries of universities [9]. ERP systems are modular application software that helps businesses increase the productivity of such mission-critical components as human resources, finance, parts purchasing, inventory control, supply chain and customer relationship management. ERP systems are enterprise-wide and claim to incorporate best business practice that replaces legacy systems and current business processes. The leading ERP vendor is SAP. SAP maintains about 35% of the worldwide ERP market [7] and its ERP product is called SAP R/3.

SAP R/3 is based on an overall business model that makes possible a uniform view of all data and business processes in a business. SAP R/3's integration allows information to be entered into the system only once; this information then becomes part of the entire business's information system. SAP maintains a presence in all kinds of organizations such as: automotive, consumer products, chemical, manufacturing, oil and gas, high-tech pharmaceutical, and communications.

The variety and extent of ERP systems throughout the world offers university graduates having knowledge of ERP systems viable employment opportunities and career paths.

2. ERP Curriculum in Universities

Many universities have identified the value of incorporating ERP systems into university curriculum. ERP systems can be used to reinforce many of the concepts covered in the business discipline [2]. The systems incorporate “state of the art” technology providing a comprehensive teaching tool for computer science and information systems subjects [10]. Universities that have successfully incorporated an ERP system into their curricula find unprecedented student demand for those subjects.

Even though the value of including ERP systems into the curriculum has been identified, there are a number of barriers preventing this from happening. One significant hurdle is the limited knowledge and experience of academic staff charged with the responsibility of integrating ERP curriculum into their courses. ERP systems are complex and the time required by staff for developing curriculum is far in excess of the time experienced for curriculum development in other areas. The shortfall of academic skills and experience is further compounded by the limited access to relevant ERP professional development activities and the continual upgrade of software.

Another significant barrier to the use of ERP systems in universities is the perceived need for students to gain “hands-on” experience to master the concepts inherent in these types of systems [15]. In the past, if a university decided to incorporate a major software product into its curricula, it would have purchased the software and set up the necessary infrastructure to support it. ERP systems themselves are expensive but there are the additional associated costs of hardware and professional development for the computer support staff together with the necessary incentives to retain these people once they are skilled. Many universities find that the barriers associated with introducing ERP systems are just too great!

An increasing number of universities are investigating strategic alliances with ERP system vendors to provide the support for incorporating ERP knowledge into their curriculum [8]. The ERP vendor benefits from these alliances by increasing the supply of skilled graduates that can support their product thereby enhancing its marketability. Chan and Welebir [4] highlight the competitive advantages universities can gain by forming alliances, particularly their benefit in leveraging into the global e-education market.

The SAP University Alliance Program in Australia is an example of a strategic alliance between a number of universities and an ERP vendor. As part of the alliance, SAP provides approximately \$2.5 million worth of its product and technical and professional support for the

integration of SAP R/3 into the curriculum. However it is still the responsibility of individual academics to develop the necessary curriculum and the university to provide the necessary infrastructure to support the system.

3. The SAP Alliance at Victoria University

The Faculty of Business and Law on behalf of Victoria University joined the University Alliance Program in 1998. Up until then university alliance members had focused SAP R/3 around one particular department rather than an overall faculty. The faculty approach was believed to be a better method to facilitate the incorporation of SAP R/3 into curriculum. ERP systems support the various business processes within an organization. The respective departments within the faculty teach these processes and therefore the faculty approach enables each department to focus on the aspects of the software which is relevant to them.

Since joining the SAP University Alliance Victoria University has developed a Graduate Certificate, Graduate Diploma and Master of Business in Enterprise Resource Planning Systems as well as incorporating SAP R/3 into several undergraduate subjects. Currently we have 15 staff teaching more than 20 subjects at both the undergraduate and postgraduate levels to approximately 700 students.

Many higher education institutions are making plans to globalise their courses. Victoria University is no exception and offers a broad range of academic programs throughout the Asian region. The international programs involve over 3000 students from Malaysia, Singapore, People’s Republic of China and Bangladesh. Many of these universities have indicated that they wish to include ERP related subjects in their courses. While there have been indications that the high growth rates in the ERP market of recent years have somewhat dwindled, good growth has been maintained in many Asian markets with the expectation of continued growth in the foreseeable future [13]. SAP has established a University Alliance Program in many Asian countries to assist with provision of appropriately educated consultants to support this increased market. However even though these alliances have been established many of the universities have had difficulties in developing curriculum due to lack of skilled staff and available resources. Increasingly Asian universities are forming partnerships with western universities in an endeavour to broaden their curriculum offerings and add value to their students. Clearly there are advantages to be gained by both parties in setting up a partnership to teach different aspects of ERP systems. The provider is able to derive income to recoup some of the cost of developing curricula and maintaining systems while the receiver obtains the benefits of their students acquiring ERP education without the need to

invest in hardware, staff training and curriculum development.

In 2002 Victoria University commenced the Master of Business in ERP Systems at Sunbush Business School, Singapore. In addition an agreement has been signed to commence our ERP masters program at the Northern Jiaotong University, P.R. of China in 2004.

4. ERP E-Learning Model

Many e-learning models have been developed and trials conducted in recent years. Neubauer and Lobel [11] describe a highly structured synchronous model for teaching and doing research on medium to large sized groups over the Internet. Arnone [1] reports on the technical standards being developed to allow colleges in the US to customise distance-learning programs by blending online-learning software from several vendors. Ehrmann and Collins [5] describe examples of virtual classrooms that use the Internet to create new kinds of collaboration and learning. Tansley and Bryson [14] evaluate the implications of replacing traditional modes of small group teaching with “virtual seminars”.

Victoria University has developed an e-learning ERP model to facilitate the teaching of ERP systems in our offshore ERP programs. This model uses a number of e-learning technologies that blend synchronous and asynchronous content. Asynchronous e-learning does not involve the presence of the teacher. Typically the learning content is located on a web server that students can access using the Internet. The content can be interactive but the presence of the teacher is not required. Typically asynchronous e-learning is implemented by Web-based training (WBT) and may include online forums, threaded discussions and download materials. Synchronous e-learning requires the learner and teacher to be present in the event at the same time. It is a real-time, instructor-led online learning event in which all participants are available at the same time and can communicate directly with each other.

To support offshore teaching a model for ERP e-learning has been developed and has been applied in Singapore since 2002. It is also used in a limited way in an offshore program in Hong Kong. The model blends synchronous and asynchronous content and integrates four major technologies which provide a comprehensive medium for online learning. The technologies are:

4.1 Application Service Provision

Application Service Provision (ASP) is responsible for providing the necessary technological infrastructure and support to host a particular software product. This enables the clients of the ASP to remotely access the software via the Internet. One of the barriers to ERP education mentioned earlier was gaining access to the ERP system and providing the necessary infrastructure. The ASP model provides a solution to overcoming this barrier.

Victoria University has configured one of its SAP servers to support the role of an ASP to its partnering universities in Asia. Students from these universities can access the SAP software at Victoria University via the Internet once they have installed the SAPgui software on their local PC's. Students can access the SAP software from anywhere in the world as if they were sitting in front of a PC at Victoria University.

The control and administration of the ERP system is still the responsibility of Victoria University and allows our Asian partners to access SAP R/3 without the need to purchase an expensive computer server and employ the necessary support staff. Through the use of clients in the SAP R/3 the system can be individually configured to suit the learning objectives of each offshore institution.

4.2 Web-CT

Web-CT is a web based tool which acts a repository of learning materials to assist students with their ERP education. Web-CT has tools for storing and delivering course materials including text, graphics, audio and video. Material can be released according to various criteria, such as date and student name.

Web-CT also has tools for organising and enhancing course material, communication tools so that chat, “internal” mail, discussion groups and whiteboards can be made available for use by students and instructors and tools for monitoring student progress and providing feedback.

In terms of ERP delivery the Web-CT site allows students to view and download subject outlines, assignments, past examination material and lectures in various formats. Students can submit assignments via the site and then view their results once the assignments have been marked. Chat facilities can be enabled to allow students to discuss set tutorial questions and discuss issues they have encountered. This interaction may occur between students within their tutorial, university, other Asian universities, or Victoria University.

Web-CT is used as the foundation to deliver the asynchronous e-learning content in the ERP offshore program.

4.3 iTutor

This tool is used for developing interactive tutorials in a simulated SAP environment. It enables the lecturer to record an action or transaction within the SAP environment and capture the screens involved to form the basis of a tutorial. After recording the tutorial, the iTutor Editor is used to edit the structure of the tutorial, define alternative paths (branching), edit instructional texts and create additional supplementary descriptive texts. This facility allows educational concepts to be inserted into tutorials using tools such as PowerPoint. The computer-based tutorials enable students to combine ERP theoretical concepts with the appropriate SAP screens and actions. Students can replay the tutorial as many times as necessary to understand the concepts.

The iTutor tool enables staff in the Asian location to have access to a repository of ERP educational materials overcoming the lack of resources barrier identified earlier. The Virtual Classroom technology is used for plenary sessions to reinforce the concepts covered and answer any questions coming out of the iTutor tutorials.

This tool has the added benefit of capturing and storing a lecturer's knowledge that can then be reused by others at a later stage either in a different subject or to assist if the lecturer is no longer available.

4.4 Virtual Classroom

There is a growing trend amongst academics to use the Internet to increase access to educational materials in a variety of ways to support the learning process [12]. The ASP enables access to the ERP system while the Virtual Classroom technology provides access to the curriculum.

The virtual classroom tool enables synchronous e-learning whereby the learner and teacher are present in the event at the same time. It is a real-time, instructor-led online learning event in which all participants are available at the same time and can communicate directly with each other. This virtual classroom capability is facilitated by the Centra Corporation virtual classroom software (Central Symposium) which provides the capability to deliver live, instructor-led classes direct to student desktops using fully integrated voice-over-IP technology. This is used to present theoretic concepts related to ERP Systems and practical demonstrations related to SAP software. Lesson delivery includes integrated full-duplex audio, interactive whiteboards, application sharing, breakout rooms and

online surveys and evaluations. The technology allows lessons to be recorded for editing and playback. Centra Symposium is very powerful as it integrates many interactive tools that can be used in the live delivery. Of particular note is the "Application Sharing" tool that allows an application stored on the presenter's PC to be viewed on the students PCs. The presenter can demonstrate features of the application to students in the session and also give control of the application to individual students and allow them to utilise and manipulate the application. This is a very powerful feature and quite unique.

If a student has a query, they can "summon" the lecturer via the Virtual Classroom and the lecturer can then appropriately respond to the query. This two-way communication facilitates the interaction between the lecturer and student thus enhancing the learning process. This has been lacking in many of the online solutions up-to-date.

5. Conclusion and Future Directions

The four e-learning technologies that blend synchronous and asynchronous content are not unique but combining these technologies to present ERP education is unique. They provide an avenue for ERP e-learning using a variety of methods to cater for students' differing needs and learning styles. The e-learning model has become increasingly relevant in light of recent issues such as SARS and terrorism that have acted to inhibit and disrupt offshore education.

We are using the ERP e-learning model with our partners in Singapore and Hong Kong. We are still in the early implementation stage. Once fully implemented we will carefully analyse the effectiveness of the model. If we find it successful we plan extend our ERP e-learning model to include our other partnering universities throughout the Asian region. Beyond this we would explore the possibility of offering ERP education to anybody who enrolls online into any of the subjects on offer. This would be true e-learning as it provides the accessibility and flexibility to overcome the geographical barriers, ideologies, work commitments and traditional course structures that have prevented people from acquiring ERP knowledge and skills.
