Abstract

This paper addresses the growth and development of the concept of interactivity in online newspapers from the perspectives of computer-mediated communication, journalism, advertising, and information system. This paper discusses the concept of interactivity that originated in the work of Heeter. The study maps Heeter’s dimensions (content, availability and choice, communication opportunity, effort of users, responsiveness, and customisation and management of information) in the contemporary setting of the Australian online newspaper industry. The researchers reviewed 12 Australian online newspapers in two snapshots using a website content analysis approach. The results are the basis for discussion as to the level of interactivity in Australian online newspapers. Content availability and choice was found to be the most significant element of interactivity. It is noted that, while the majority of Australian online newspapers offer interactive functionality for expressing opinions, blogging, contests and polls, only one online newspaper provided genuine interactive gaming.

Keywords

Interactivity, Australian Online Newspapers, Website Content Analysis.

Introduction: An Overview of Online Newspapers

The phenomenon of the online newspaper is one consequence of the expansion and significant development of Internet and the World Wide Web (WWW) in the mass media. It has been said that 70% of Australians are Internet users (Central Intelligence Agency’s World Factbook) with 10 million of them active users according to the Nielsen (2006) NetRatings report. Accessing online newspapers is part of many individual’s daily life to keep abreast of current events. The World Association of Newspapers (WAN) was mentioned in the Asia Media (2006), indicating a 9% increase in global readership for online newspapers in 2005. This is a enormous 200% increase since 2001. This is, however, not surprising given the increasing importance placed on the Internet as a global communication medium. This growing popularity provides new avenues for the newspaper industry.

In Australia, a report from Hitwise revealed that the Sydney Morning Herald is the site most bookmarked by users, with 4.36% global share in year 2003 (Greenspan 2003). Significantly, the newspapers readership survey released by Roy Morgan Research (2005), found that the Herald Sun, Daily Telegraph and Sydney Morning Herald were the top three with readership of 1.5 million, 1.2 million and 0.9 million, respectively. Moreover, a report released from the Audit Bureau of Circulations (ABC) stated the size of the online audience of the Sydney Morning Herald increased 16% within the 6 months time frame, from April 2005 to September 2005 (Lee 2005). For this study, the researchers categorised newspaper readership as high, medium, or low from a survey by Roy Morgan Research (2005) in order to identify the top Australian readership of online newspapers (refer Table 1). From the results, the Herald Sun scores the highest rank (7.4%); while, the Courier Mail and Western Australian share in the medium rank (3%) and the Northern Territory online newspaper is ranked low with 0.3% of the Australian population.

The availability of appropriate technologies has revolutionised the online newspaper industry in Australia with new ways of disseminating news and other services. Media services now have more attractive; products and news that are delivered in real time, with increased quantity of information as news are upgraded with photographs and videos. Overall this has enhanced the richness and timeliness of news (Gilder 1994). In some
cases, news coverage is extended to editorials, feature writings, forums and blogs giving it more variety and appeal. Leading researchers (Palmer & Eriksen 1999; Deuze 2003; Boczkowski 2004) applauded this practice noting that online newspapers must exert multimodality, which offers more communication opportunities and interactivity. Whatever the device, the element of interactivity is crucial. Since Heeter’s (1989) seminal study, many researchers have adopted and revised the aforementioned six dimensions to contextualise their findings. Although these studies identified different features of interactivity, they all recognise the importance of these elements in improving the web delivery to attract web visitors’ attention and involvement during their visit. However, little research has been conducted within the Australian context with regard to interactivity.

Resource: Roy Morgan Research, 18 August 2005

In light of this, the study reported here was designed to explore the notion of interactivity within the Australia context by investigating the online newspaper industry. A thorough content analysis was conducted; mapping the website content and objects to Heeter’s dimensions. The findings serve as a preliminary assessment of the content and web objects that encapsulate interactivity within the websites. This will then be used as a benchmark for Australian online newspaper websites to draw out appropriate discussion in terms of the background of the study as presented in the next section. The next section also presents a comprehensive compilation of numerous studies related to interactivity. This is followed by a section that describes the methodology used in this study, the data sources and analysis. Then, the findings generated from the web-site analysis of twelve Australian online newspapers are presented. In discussing the findings, we highlight the changes in the content and web objects that were observed over the period of the analysis. Lastly, we conclude with some recommendation, the research limitations and suggestions for future research.

Adopting Interactivity Dimensions

Previous Research

There are numerous studies linking the Internet with the concept of interactivity. These attempt to identify the dimensions, benefits, and implications of interactivity from various perspectives and disciplines such as communication, computer-mediated communication (CMC), marketing, and information systems. However, as the functionality and availability of the Internet is evolving at a great rate, the understanding of this important aspect of interactivity remains vulnerable and deficient. Referring to the definition in Webster’s New Millennium Dictionary of English (2005), the verb ‘interact’ means ‘to act on each other’, particularly related to activities which involve a social context such as a conversation, playing games, acting or even dancing. This interaction involves negotiation, cooperation, coordination or influence. In the meantime, the term ‘interactivity’ means ‘the extent to which something is interactive’, and more specifically ‘the extent to which a computer program and human being may have a dialog’. In the realms of the Internet, these relate human to human communication activities; and also those of human to computer interaction involving receiving and disseminating inputs, messages, data or commands.

Early researchers from the communication literature noted that communication is mostly about, and for the purpose of, interaction. The best known and earliest definition of interactivity was from Rafaeli (1988, p. 111), namely: “An expression of the extent that in a given series of communication exchanges, any third (or later) transmission (or message) is related to the degree to which previous exchanges referred to even earlier
transmissions”. Subsequently, Rafaeli and Newhagen (1996) proposed five defining qualities of communication on the Internet: multimedia, hypertext, packet switching, synchronicity, and interactivity. Hoffman and Novak (1996) described interactivity as both the ability to communicate with people (person interactivity) and access information (machine interactivity). Significantly, many believe that interactivity is now the primary characteristic of new technologies and this is motivating a considerable reassessment of communication research (Heeter 1989; Morris & Ogan 1996; Rafaeli & Newhagen 1996; Rafaeli & Sudweeks 1997; Ha & James 1998).

Because of the importance and the variety of approaches to the topic, researchers have attempted to settle upon a single definition with multiple concepts of interactivity. From the work of Pavlou and Stewart (2000), interactivity was defined as an attribute of the consumer, not a characteristic of the medium; as consumers can choose to respond or not. Interactivity is not really new but what is new comes from the speed, scope, and scale of interactivity. These are provided by new information and communication technologies, which make online activities simpler, cheaper and easier. On the other hand, Kopper et al (2000) state that interactivity is the characteristics of the Internet that facilitates association, enabling people not only to receive information (a passive audience) but also to disseminate it. Meanwhile, Kiousis (2002) places stressed more on users as participants who are able to communicate both synchronously and asynchronously, and engage in reciprocal message exchanges. Additionally, Kawamoto (2003) claims that interactivity is “a process of engaging active human or machine participation in the process of information seeking and information sharing”.

Significantly, most definitions of interactivity, and the associated body of literature, were developed from the computer-mediated communication (CMC) perspective. Among this body of work is the categorisation of elements of interactivity by Heeter’s (1989) and this study is based on her six elements of interactivity, namely:

- the complexity of choice available: users are provide with a choice of available information or selectivity,
- the effort users must exert: the amount of effort users must take to access information,
- the responsiveness to the user: the degree to which medium can react responsively to a user,
- the monitoring of information use: potential tools to monitor system use,
- the ease of adding information: the degree to which user can add information to the system that a mass can access, and
- facilitation of interpersonal communication: the degree to which media system facilitates interpersonal communication between specific users.

Many researcher have adopted Heeter’s study as it is one of the few analyses of interactivity that offers specific measurable dimensions (Ha & James 1998; McMillan 1998; Massey & Levy 1999; Kenny, Gorelik & Mwangi 2000; Massey 2000; McMillan & Hwang 2002; Gustavsen & Tilley 2003; Şanlier & Tağ 2005). These researchers have enriched the concept of interactivity by conducting studies involving the Internet, graphics audio and video technologies from disciplines such as marketing, journalism, and information systems. Table 2 demonstrates the diversification of Heeter’s interactivity dimensions to various fields and disciplines.

</table>

The Five Dimensions of Interactivity

Based on the above review of various interactivity definitions and frameworks, this study proposes that interactivity should be defined on a continuum with the highest level of interactivity occurring when there is human-to-human and human-to-machine communication. This follows Stromer-Galley (2004) emphasis on two phenomena: interactivity between people and interactivity between people and computers (or networks). Increasingly online readers want the freedom to use and navigate websites, not only retrieving news online but also communicating with other readers and having a need to be ‘engaged’. Therefore, this research posits the following five dimensions of interactivity as most significant to online newspapers websites. The researchers have investigated Australian website content and objects by mapping them to appropriate dimension for the content analysis, similar to Yadav and Varadarajan (2005) in attempt to operationalise marketplace interactivity. The mappings are justified and presented in the following sections, categorised by each dimension.

Content Availability and choice. The researchers introduce a new concept, Peripheral Value Proposition (PVP) based on the widely accepted term value proposition (VP). For the purposes of this study VP represents news information content, while PVP refers to non-news information content. The word ‘value proposition’ is well known in the business and marketing area, and refers to the customer segment that a competitor targets and states the primary differentiation of a product or service (which portray an image brand) from competitors. According to Chaffey et al. (2000, p. 145), “an Internet website should have an additional value proposition to further differentiate a company’s products and services. A clear Internet value proposition has several benefits: distinguish the site from its competitors, provide a focus to marketing efforts, and company staff are clear about the purpose of the site, and can be linked to the normal product propositions of a company or its product”. In the online newspaper environment, the proposition offered in the website should be clear content, providing news and related news information to readers, which should synchronise with the news company’s objectives, products and services. The VP for an online newspaper is mainly concerned with news related items, for example news articles placed on the front page, provide links to articles on the same issue, latest news update, news in audio, video, and pictures, archives, and news alerts. The PVP in this context means, non news related items, for
instance offering the company’s business information, a SiteMap, a search engine, choice of languages, advertisements, graphs/charts, job opportunity, and weather updates. PVP can also include infotainment such as games, polls, contests, cartoons, and entertainment guide.

**Effort of Users.** This can be classified as the amount of the user’s activity required to complete their task. In the case of online environment, clicking once too often to retrieve news or information can be exhausting and discouraging. The user would want to minimise their effort in retrieving the news or desired information to provide flow opportunities (Novak, Hoffman & Yung 2000). Based on Loiacono et al. (2002) the ‘intuitiveness’ of the each website page is important to the user to read, understand and also navigate easily between pages. This also means that the connectedness or ‘the flow’ using hyperlinks providing a range of ‘easy and fast’ links and avoiding broken links, will impact the effort of users in accessing news or information. In this context the main hyperlinks flow refer to links within the same subdirectories site of a home page, for example: <http://www.smh.com.au/news/health/another-day-at-the-office/2007/05/22/1179601414005.html> is a hyperlink from <http://www.smh.com.au/>. Another less important type of hyperlink refers to another site, such as <http://www.smh.com.au/> to <http://moneymanager.com.au/>.

**Communication Opportunity.** This dimension refers to dissemination of information; asynchronous (one-to-many interaction) and synchronous communication (many-to-many interaction). It contains three types of communication opportunities; sessional, semi-permanent and permanent communications. Sessional communication is the type of communication which has a ‘cut-off’ time once the user log off or ends off the connection. For example, a Chat room, video conference, games and multiplayer game (video game in which multiple people are able to play within the same time). Semi-permanent communication refers to communication that has time limits or display in certain time frame. Emails, forums, opinions letters, and bulletins are examples of semi-permanent communication. Finally, permanent or archive communication refers to communication which is ‘put on view’ on the website for longer period of time. A Web blog (web-base publication diary consisting of periodic articles with text, images and related media/web links) is in this category.

**Responsiveness.** According to (Alba et al. 1997) response time concerns the speed of response via computerised interface. This could be captured by the time lapsed in between a stimulus and the response to it. Responsiveness here has two aspects: firstly, the level of responsiveness between the reader and webmaster, editors and/or reporters (two-way communication), and secondly, computer response or system response time. System response time refers to time taken by the system in reacting or retrieving news. Ideally, the response time is minimal and the result of a request is reflected immediately to the reader. For example, Bouch et al. (2000) assigned the range of latency/response time into three stages: high (0-5 seconds), average (6-10 seconds) and low that is more than 11 seconds. These responsiveness factors are the key to productivity in interactive applications especially to Web usage.

**Customisation and information management.** On a website, customisation and information management leads to a highly interactive experience. Through personalisation, a user is able to ‘custom make’ any news he/she requires. The personalisation may be done by the user through a registration process. Personalisation options of online newspapers range from choosing topics and news headlines, getting newsletters and alerts/updates via emails, community information and/or events calendar. From these activities, customer profiling (Wiedmann, Buxel & Walsh 2002) can be developed and it is a key to identify customers’ demographic and behavioural analysis. Besides that, web tracking by cookie files and hit counters (which are now run by a web agent) is one of the ways to capture user interests on relevant information. This study also includes privacy as part of the dimension of customisation and information management. Privacy refers to the degree to which an individual can determine which personal information is to be shared. In terms of the Internet, privacy means the quality of being secluded from the presence or view of others (disclosure) and the condition, which been concealed or exposed. When a user somehow feels secure in using a website this will develop a level of trust and loyalty.

**Methodology**

This study was conducted using website content analysis, on those websites which cover the subject material normally found within print newspapers. This is explained in the study from Krippendorff (1980) that identified four primary advantages of content analysis: it is unobtrusive, it accepts unstructured material, it is context sensitive and thereby able to process symbolic forms, and it can deal with large volumes of data. All of these advantages seem to apply equally to the Web as to media such as newspapers and television. Hence, McMillan (2000) itemises five primary steps that are involved in the process of conducting analysis research for application to the Web. These steps are: formulate the research question and/or hypothesis, select a sample, define categories, well train the coder to determine reliability, and, finally, analyse and interpret the data. Nevertheless, the challenge of doing Web content analysis is significant. Bates and Lu (1997) believe that, “with the number of available websites growing explosively, and available directories always incomplete and overlapping, selecting a true random sample may be next to impossible.” Ha and James (1998) also claim that coding a website can be extremely time-consuming and introduce biases based on website size. Therefore, the study will take into these
concerns into account and follow the primary steps mentioned to ensure a smooth process of conducting content analysis research of the Web.

The study uses Li’s (1998), Massey and Levy’s (1999), and Massey’s (2000) method which analyses the key part of online newspaper’s home page. The homepage or front page is the most often visit by Internet users because this serves as the ‘front door’ to visitors and it is the point at which most web features are implemented. If visitors have to search through several steps to find a feature, they are likely to experience frustration and leave. To begin with, the coder set and saved twelve web addresses (for example, http://www.smh.com.au/) in the computer (Added to Favourite) as the default page domain to standardise and make the coding process easier. Only one coder was involved so that no between coder reliability measure was required. The chosen websites were originally operating as print-based newspapers only. Two different snapshots were undertaken; first in autumn 2006 and another a year later. As explicated above, the five major interactivity features were measured:

- content availability and choice – value proposition (news links placed at the home page, related news items, news updates, news in audio, video, and pictures, archives, and news alerts) and peripheral value proposition (sitemap, search engine, choice of languages, advertisements, graphs and/or charts, jobs, weather updates, and infotainment like games, polls, contests, cartoons, and entertainment guide),
- communication opportunity – sessional (chat room, video conference, games), semi-permanent (Emails, forums, opinions letters, and bulletins), and permanent communication (web blogs),
- effort of users – easy to navigate (offer registration before retrieve news, getting news with single click and multi clicks) and connectedness (offer links within same subdirectories and other sites),
- responsiveness – user response time (communication between user and reporter/editor), and system response time (time taken in retrieving news), and
- customisation and management of information – personalisation (require user’s password), hits counter and privacy (clear statements of privacy policy act, user’s security and access to the collected information, shared third party or partners, and contact details).

**Results**

Content availability and choice was found to be the most significant element of interactivity featured prominently in the top four Australian online newspapers (Herald Sun, Daily Telegraph, Sydney Morning Herald, and The Age). However generally, all twelve newspapers indicated an increase in the amount of news on their homepage between the two snapshots, although not all top stories provided relevant links within the issue. Comparing 2006 to 2007, The Canberra Times and West Australian demonstrated more than a 80% increment of news, followed by the Australian Financial Review (AFR) with a 75% increment. In addition, there were now significantly more news articles displayed with pictures and videos. The majority prominently identify the latest news update by using titles such as, *Breaking News*, *Latest News* and *News Wire*. AFR also provided the time and source of news (e.g.: Reuters and AAP) in each news article. Unfortunately, AFR launched a subscription service in mid year 2006 and this limited the study by restricting free analysis on the AFR website. Archives and news alerts are the other most available content elements in Australian online newspapers. Surprisingly, The Australian and Canberra Times placed editorial cartoons on their homepage as all others, except Northern Territory, provide a link to this feature. In addition to the VP elements, PVP elements had some significant findings. For example, a large amount of advertisements and contests appeared on homepages. The Canberra Times offered an in-house search engine similar to those owned by News Corporation. Others that were owned by Fairfax and the West Australian, offered both internal and Yahoo search engines, none had Google. The majority locate weather, entertainment guide (except AFR), calendar, company’s background, and jobs opportunity information within the homepage. Herald Sun, West Australian and Daily Telegraph included internal recruitment opportunities. Unfortunately, no choice of languages was offered by any of the Australian online newspapers.

In regard to the effort of users, most news was retrieved only with a single click from the homepage. This is in line with Massey and Levy (2000) who also found ‘hard’ news published and carried through at most one link. Links within the same site were found more frequently than links to other sites. As mentioned by Ha and James (1998), most companies only wanted to confine their visitors to the connected world of the company and not to other sources. On communication opportunity, the majority of online newspapers (excluding West Australian, Mercury and Northern Territory) offered discussions – semi permanent communication, for instance Opinions and blogs (permanent communication opportunity), which give readers the opportunity to interact and draw comments in addition to other channels such as Letters to Editor and Feedback columns that are generally available. For sessional communication opportunities, the Northern Territory was the only online newspaper to gratify users’ desire for a games element (15 games). Neither chat rooms nor a reporter’s direct email on a news article was found in this study.
In respect of responsiveness, AFR, which was placed in the medium category, has an average system response time (within 6-10 seconds). The graphs and charts that are frequently placed on the home page may be responsible for this. In terms of the user’s response time, some were in the high and medium category. Online readers were expected to receive notification of email on average within 72 hours. Other interactivity elements were equally poor for example, with respect to customisation and management of information many are not clear on their privacy policy. Some such as The Canberra Times had no information on customer’s full access to the collection of information and no contact details were provided.

Comparing the news outlets throughout the year, The West Australian had a tremendous change from a simple website to a competitive layout displaying more news links, pictures and increase online advertisements. Meanwhile, the Canberra Times had significant change by increasing news links, adding in new columns such as a regional news folder at top right of the page, send us your news and Reader's Poll at the centre or the page, and most viewed articles at the bottom. Overall, there were no changes on the SMH and The Age sites. In fact, they shared similar layout except for the content priority between National and World news. There were just some content differences; Column 8, Entertainment Blogs and Obituaries Column were not included in The Age online newspaper. Meanwhile, The Courier Mail and The Australian online newspapers, owned by News Corporation maintained the same layout across both years. The current layout for the Herald Sun, Daily Telegraph, Advertiser and Mercury appear to resemble The Courier Mail website design. In specific, the Herald Sun and Daily Telegraph menu folder was shifted from the left to top of the page to now incorporate a ‘multimedia’ screen at centre and bottom page. The Advertiser, were recently named Adelaide Now, carried a similar design but with different colour presentations. The Mercury now has additional columns such as Your Say, Our Say, and Entertainment: Gigs and Events which were included in the new outlook. Lastly, Northern Territory is judged to be the simplest layout compared with others under News Corporation. It now has an even simpler layout than the previous year with no sitemap and most news links revert to the main News Corporation news website. In the 2007 snapshot, we saw distinctive developments of coherent image and standardisation from the big company like Fairfax and News Corporation.

**Discussion and Conclusion**

This exploratory study investigated interactivity concepts in online newspapers within the Australian environment. The researchers used a website content analysis approach to map Heeter’s six interactivity dimensions, namely: content availability and choice, effort of users, communication opportunity, responsiveness, and customisation and information management. Two snapshots of the websites were taken on two different days twelve months apart. As expected, the results show an increase in the number of news items placed on the homepage of online newspapers. Also obvious is the improvement in presentation with varied colours, pictures, slides, audio and videos. The importance of this was noted by Gilder (1994) who stressed that the news industry needs to attract more readers in delivering their products and news in real time, increasing the quantity of information, upgrading news with photographs and videos while enhancing the richness and timeliness of news. Non news links have also increasing. New designs now incur users less effort in retrieving news. This is in accord with the research of McMillan (1998), Heeter (1989; 2000), Dholakia et al (2000), and Deuze (2003). They stressed the importance of easy navigation structures especially at the front page of the website as shown in this study, which is central to avoid user exhaustion while reading online news.

As to future directions, Australian online newspapers may need to consider the playfulness element as mentioned by Ha and James (1998), which arouses reader’s curiosity. From the results of this study, the Northern Territory was the only Australian online newspaper that incorporated games while the rest merely offer contests and polls. Clearly, curiosity avenues like games will attract readers’ attention and entice their participation during their visit to an online newspaper, for example online Sodoku and Wordo. This could be a turning point for an online newspaper companies who lack emphasis on elements of infotainment and entertainment. Moreover, this may attract the younger population to visit the website. According to Bressers and Bergen (2002), male and female users differ, as female access more science/health news, entertainment news and local news. Indeed, online newspapers are evolving and interactivity is the keyword (Kenny, Gorelik & Mwangi 2000; Sanlier & Tağ 2005). Interactivity improvements could allow users not only to link with local related news and relevant sites, to access original source material, audio or visual materials, archives, online discussion groups and newspaper staff etc; but also to allow users to create their own news stories. Online newspapers should also incorporate diversification of online products and engage elements of playfulness which include developing products designed to attract specific demographic groups, for example, males, to read and play on recreation/sports (Ha & James 1998; Bressers & Bergen 2002).

This study serves as a preliminary study in exploring interactivity among Australian online newspaper industry using website content analysis approach, while future research should seek more creative users’ perceptions towards online newspaper. Looking at the increasing capability of computer technology, the news industries should try to attract and engage more readers by delivering their products and news in real time, increased the
quantity of information, upgrade news with photographs and videos while enhanced the richness and timeliness of news. In some cases, the news industry has expended their news coverage with extended editorials, feature writings, forums and blogs, but more could be offered such as in Three-dimensional (3D) virtual environment - Second Life. As Palmer and Eriksen (1999), Deuze (2003), and Boczkowski (2004) agree, online newspapers must expand in multimediality, which offer more communication opportunity and interactivity. All of these elements can be added into modern interactive media and may able to facilitate the effector growth. Such featured devices hopefully, may attract the future web visitors’ attention and involvement during their visit to online newspapers.
